

The Ultimate Security for Your Linux Web Server

Your website is the lifeblood of your business. CloudLinux's next-generation security solution protects your Linux web servers from digital attacks and is offered as a comprehensive version, Imunify360, and a light version, Imunify Sensor.

Imunify360 uses herd immunity and the six-layer approach providing complete, automated protection against attacks. It is powered by the technology that is constantly collecting and analyzing a massive amount of information about new attacks on a global scale so that you can benefit from it the moment you start. Imunify360 gives you powerful security features, such as advanced firewall and smart intrusion detection system, as well as the centralized view, right inside your control panel, to check in on the overall state of your server's security.

Imunify Sensor, the light version, provides a centralized interface for all external attacks coming to your server. It collects information, sends it to the central server, and provides you with a detailed report of all offending IPs and attacks coming from each IP. It plugs into your existing logs to identify brute force attacks, port scans, DoS attacks, and other various attacks against your web applications based on the WAF firewall you might already have on your server.

Explore the below comparison chart to know which product is right for you. With several high-performance features already available, and many to be released in the upcoming months, it can protect Linux VPS and Dedicated servers from digital attacks.

Imunify360 vs Imunify Sensor

		
In a nutshell ...	Maximum security with sophisticated attack detection \$35 per server/mo	Basic security with lightweight attack detection \$9 per server/mo Free for CloudLinux OS

Key Features Comparison

Centralized Incident Management dashboard Allows you to quickly check in on the overall state of your server and manage all aspects of its security. Displays all security events and the latest incidents updated every 30 seconds. Learn more		
Standard Firewall Prevents unauthorized users from accessing your servers.		
Advanced Firewall with herd immunity Uses herd immunity and artificial intelligence to detect new threats. Capable of defending against brute force attacks, DoS attacks, port scans, as well as many other types of attacks. Learn more		
Smart Intrusion Detection System Collaborates with the central intrusion detection system to decrease the number of false positives and false negatives.		
IDS / IPS Includes a comprehensive collection of “deny” policy rules to quickly block all known attacks. Monitors server logs and scans log files from all different angles and bans IPs that show malicious signs. Learn more		
Malware Scanning Automatically scans file systems for malware injection and quarantines infected files	Coming soon	Coming soon

	Imunify360	Imunify Sensor
Security Scanning Detects outdated software components on your server.	Coming soon (weekly and on demand scanning)	Coming soon (monthly scanning)
Patch Management Automatically updates outdated components or notifies you about them so you can take action manually.	Coming soon	
Intelligent Web Applications Sandboxing Learns what is and is not OK for your web applications to do and can create safety sandboxes around your applications - it prevents hackers from injecting malware, defacing your site, or escalating privileges. Learn more	Coming soon	
Rebootless Secure Kernel (powered by KernelCare) Enables running a secure kernel at all times by automatically patching kernels without having to reboot the server. Learn more		
LibCare Automatically patches Glibc against vulnerabilities without having to restart the server. Learn more	Coming soon	
Hardened PHP Keeps your server secure by patching all PHP versions against known vulnerabilities. This allows you to run any version of PHP without having to update programs. Learn more		
Website Reputation Monitoring Analyzes if your site or IPs are blocked by any blacklists and notifies you accordingly so that you can take action. Learn why this is important	Coming soon (daily scanning)	Coming soon (monthly scanning)

Benefits Comparison in the Nutshell

Detection and display of security threats	 Sophisticated detection powered by herd immunity	 Basic detection without herd immunity
Protects servers against distributed brute force attacks		

	Imunify360	Imunify Sensor
Bans attackers even before they attack your servers		
Protects Web applications against malware injections and defacement attacks		
Automates securing your kernel and older PHP versions at all times		
Ultimate intrusion detection		
Take action earlier with high frequency of scanning		
More information		
Technical Support for Partners / Hosting Providers For hosting providers or resellers offering our products to their customer base or using it within their own infrastructure.	24x7x365, online helpdesk	24x7x365, online helpdesk
Technical Support for End Users For VPS and Dedicated Server customers who purchased the product directly from Imunify360 website or through their hosting provider.	24x7x365, online helpdesk	Forum only
Distribution Support	CentOS, RHEL, CloudLinux OS 6 & 7 (Ubuntu, Debian coming soon)	
Panel Support	cPanel (DirectAdmin and Plesk, ISPmanager, and no-panel coming soon)	
Pricing		
Retail Price	\$35 per server/mo (\$43 per server/mo bundle with CloudLinux OS)	\$9 per server/mo Free for CloudLinux OS
